DTEK Energy beats the schedule to secure an additional 200 MW of power for the grid

In busy preparation for the heating season, DTEK Energy has completed the overhaul of another power unit at one of the company's thermal power plants.

It is the second unit added to the Ukrainian grid capacity over the week, ahead of schedule this time.

Previously, during the summer's peak energy consumption periods, when demand remained consistently high, another power unit was also restored, contributing an additional 190 MW to the grid.

In total, over the past few days, up to 390 MW of additional power has been injected into the Ukrainian energy grid.
